The acreage, production and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The State Markets Section of the Florida Department of Agriculture and the County Agents of the University of Florida's Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

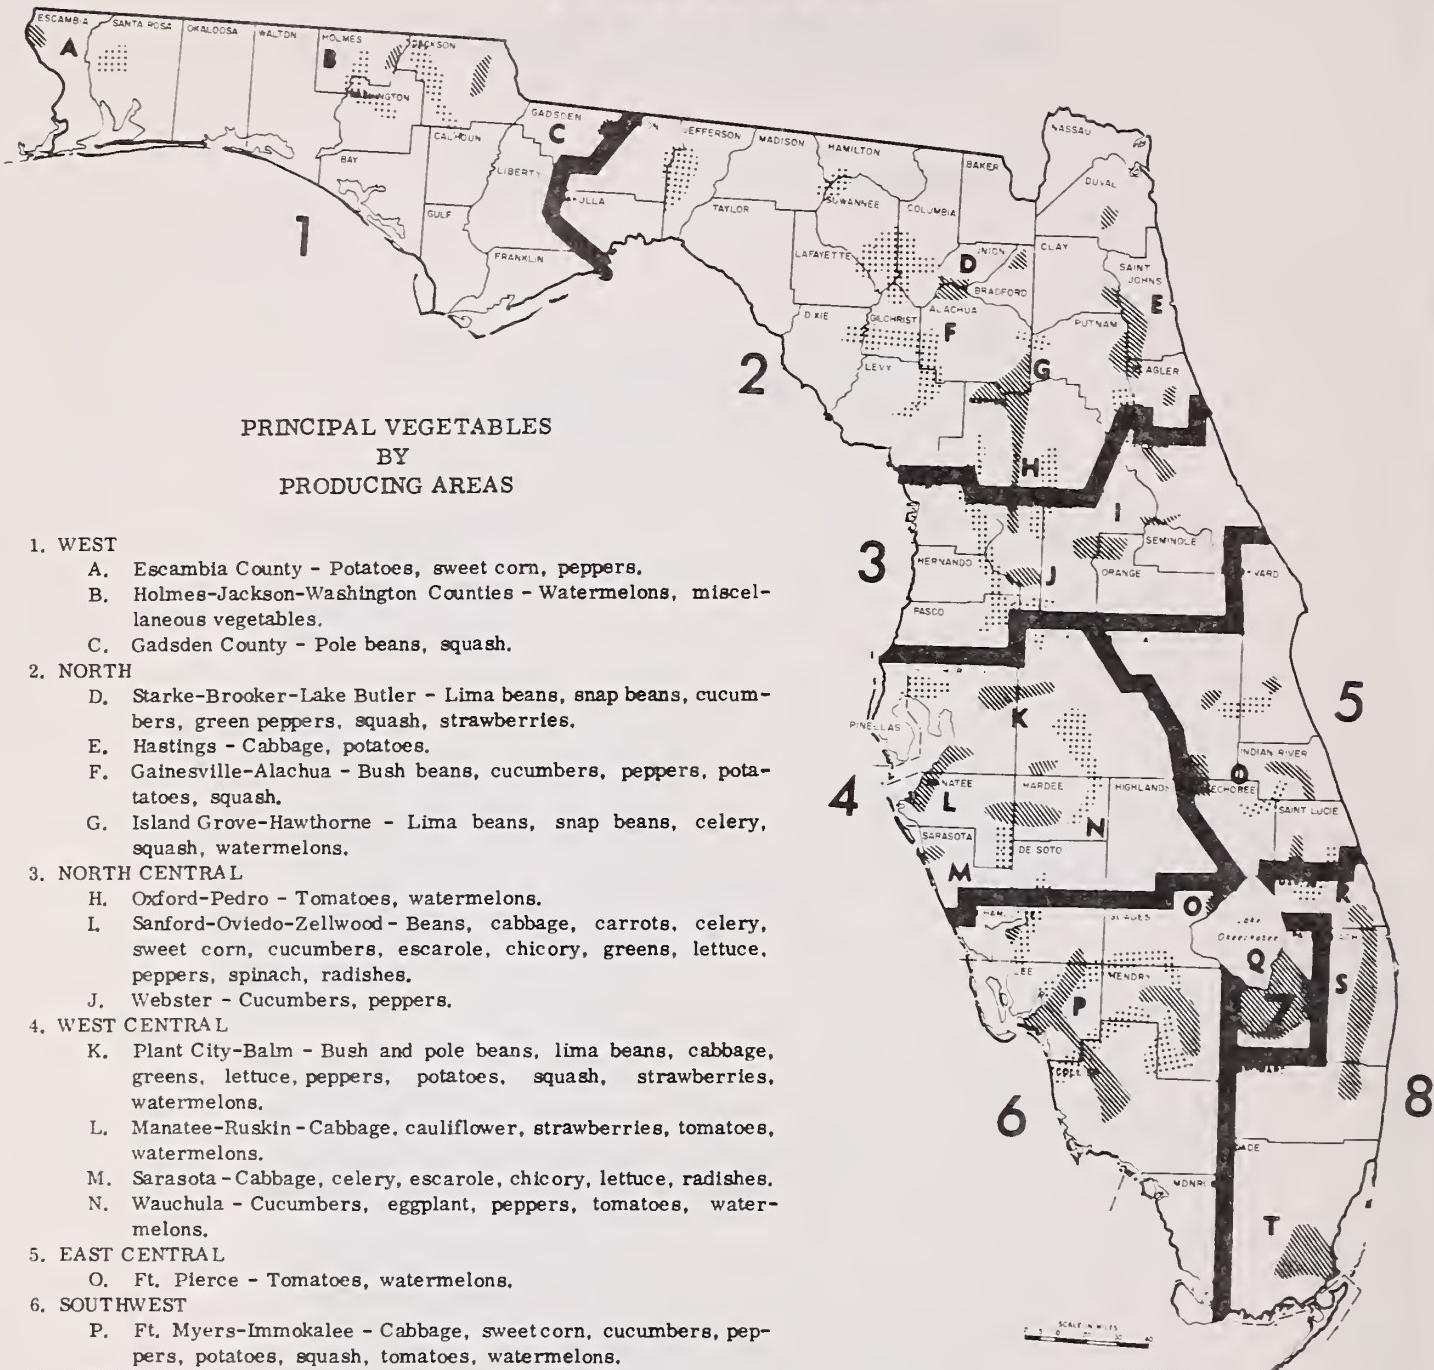

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics.

The public spirited cooperation of these individuals and groups is appreciated.

# FLORIDA

1. WEST

- A. Escambia County - Potatoes, sweet corn, peppers.
- B. Holmes-Jackson-Washington Counties - Watermelons, miscellaneous vegetables.
- C. Gadsden County - Pole beans, squash.

2. NORTH

- D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
- E. Hastings - Cabbage, potatoes.
- F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
- G. Island Grove-Hawthorne - Lima beans, snap beans, celery, squash, watermelons.

3. NORTH CENTRAL

- H. Oxford-Pedro - Tomatoes, watermelons.
- I. Sanford-Oviedo-Zellwood - Beans, cabbage, carrots, celery, sweet corn, cucumbers, escarole, chicory, greens, lettuce, peppers, spinach, radishes.
- J. Webster - Cucumbers, peppers.

4. WEST CENTRAL

- K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, greens, lettuce, peppers, potatoes, squash, strawberries, watermelons.
- L. Manatee-Ruskin - Cabbage, cauliflower, strawberries, tomatoes, watermelons.
- M. Sarasota - Cabbage, celery, escarole, chicory, lettuce, radishes.
- N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.

5. EAST CENTRAL

- O. Ft. Pierce - Tomatoes, watermelons.

6. SOUTHWEST

- P. Ft. Myers-Immokalee - Cabbage, sweet corn, cucumbers, peppers, potatoes, squash, tomatoes, watermelons.

7. EVERGLADES

- Q. Bush beans, cabbage, celery, sweet corn, escarole, chicory, greens, lettuce, potatoes, radishes.

8. SOUTHEAST

- R. Martin County - Cabbage, cucumbers, peppers, tomatoes, watermelons.
- S. Pompano - Lima beans, bush beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
- T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

■■■■■ Commercial Vegetables

■■■■■ Watermelons

**FLORIDA: Usual Dates for Planting and Harvesting Vegetables,  
Melons, Potatoes, and Strawberries**

Crop and Season	Planting Dates	Usual Harvest Dates		
		Begins	Most Active	Ends
Snap Beans, Fall <u>1/</u>	Aug 15 - Oct 31	Oct 15	Nov 1 - Dec 31	Dec 31
Snap Beans, Winter <u>1/</u>	Nov 1 - Jan 31	Jan 1	Jan 1 - Mar 31	Mar 31
Snap Beans, Spring <u>1/</u>	Feb 1 - Mar 31	Apr 1	Apr 1 - Apr 30	June 15
Cabbage, Winter	Sept 1 - Mar 15	Nov 1	Jan 1 - Apr 15	May 31
Cantaloups, Spring	Jan 15 - Mar 15	Mar 10	May 15 - June 20	July 10
Celery, Winter	Aug 1 - Dec 31	Nov 1	Dec 15 - Mar 31	Mar 31
Celery, Spring	Jan 1 - Apr 15	Apr 1	Apr 1 - May 31	July 10
Sweet Corn, Fall	Aug 1 - Sept 30	Oct 15	Nov 15 - Dec 15	Dec 31
Sweet Corn, Winter	Oct 1 - Dec 31	Jan 1	Jan 1 - Mar 31	Mar 31
Sweet Corn, Spring	Jan 1 - Apr 30	Apr 1	Apr 15 - June 15	July 10
Cucumbers, Fall	Aug 1 - Dec 15	Sept 20	Nov 1 - Dec 31	Feb 28
Cucumbers, Spring	Dec 15 - Apr 1	Mar 1	Apr 15 - May 31	June 15
Eggplant, Fall	July 15 - Sept 15	Oct 1	Nov 15 - Dec 31	Dec 31
Eggplant, Winter	Sept 15 - Nov 30	Jan 1	Jan 1 - Mar 31	Mar 31
Eggplant, Spring	Dec 1 - Mar 31	Apr 1	Apr 1 - June 30	July 31
Escarole, Winter	Aug 25 - Mar 30	Nov 1	Nov 15 - May 25	June 10
Lettuce, Winter	Aug 25 - Mar 30	Nov 15	Dec 1 - Apr 30	June 1
Green Peppers, Fall	Aug 15 - Sept 15	Oct 20	Nov 15 - Dec 31	Dec 31
Green Peppers, Winter	Sept 16 - Nov 15	Jan 1	Jan 1 - Mar 31	Mar 31
Green Peppers, Spring	Nov 16 - Mar 15	Apr 1	Apr 1 - June 15	June 30
Potatoes, Winter	Sept 15 - Dec 31	Dec 15	Jan 15 - Apr 20	Apr 30
Potatoes, Spring	Dec 1 - Feb 28	Mar 25	Apr 15 - May 31	June 30
Spinach, Winter (Proc.)	Nov 1 - Dec 31	Jan 15	Feb 1 - Feb 28	Mar 15
Squash, Fall	Aug 15 - Oct 31	Oct 1	Nov 15 - Dec 31	Dec 31
Squash, Winter	Nov 1 - Jan 31	Jan 1	Jan 1 - Mar 31	Mar 31
Squash, Spring	Feb 1 - Mar 31	Apr 1	Apr 1 - May 15	June 20
Strawberries, Winter	Aug 15 - Nov 15	Dec 15	Feb 1 - Apr 1	May 15
Tomatoes, Fall <u>2/</u>	July 25 - Aug 31	Oct 15	Nov 15 - Dec 31	Dec 31
Tomatoes, Winter <u>2/</u>	Sept 1 - Nov 30	Jan 1	Jan 1 - Mar 31	Mar 31
Tomatoes, Spring <u>2/</u>	Dec 1 - Mar 15	Apr 1	Apr 1 - May 31	June 20
Watermelons, Spring	Nov 15 - Mar 31	Mar 20	May 1 - June 30	July 15

1/ Includes Pole Beans. 2/ The planting dates apply to seeded and transplanted acreage provided transplanted acreage is backdated four weeks.

## DEFINITIONS AND EXPLANATIONS

**SEASONAL GROUPS**--Seasonal estimates are made for most vegetable, melon, potato, and strawberry crops to show supplies for a shorter period of time than the entire marketing season. This bulletin combines all seasons into a single crop year except for potatoes. The seasonal classification used for each crop is shown on the preceding page along with usual planting and harvesting dates.

**PLANTED ACREAGE** is the total acreage which has been planted for harvest during one designated season. Acreage lost and replanted to the same crop in time for harvest in the same season, is counted only once.

**HARVESTED ACREAGE** is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

**YIELD** is the average production per acre of merchantable quality harvested and sold or utilized.

**PRODUCTION** is the quantity actually harvested and sold or utilized.

**ECONOMIC ABANDONMENT** is that portion of the crop that reached maturity and was of merchantable quality but was not harvested because of labor shortages, low prices or other economic factors; or if harvested, was not sold or utilized for those reasons. Estimates of acreage and production lost because of economic reasons are difficult to define and measure and are not attempted unless such losses become significant.

**UNIT VALUE** for fresh market sales is the equivalent price received on an f. o. b. shipping point basis and encompasses all grades and sizes marketed or utilized.

Included are selling charges, precooling, icing, or other costs normally incurred at origin. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

**TOTAL VALUE** is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

**RAIL TRUCK (Piggyback)** shipments are included in the straight rail shipments shown for each crop.

**RAIL LOAD FACTORS** represent the average number of packages per rail car based on tabulations of waybills in prior years showing the contents of each car.

**MIXED CARS (RAIL)**--Loadings by stations are pro-rated by commodities, using tabulations of waybills in prior years.

**TRUCK SHIPMENTS** are converted to equivalent carlots on the basis of predetermined load factors. A minor difference of carlot equivalents in the season total obtained by adding the monthly or weekly shipments may exist because of rounding.

**PRODUCTION AND PRICE UNIT**--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to the most commonly used container. The following table gives the net weight used per container and the number of containers per hundredweight.

**PRODUCTION AND PRICE UNIT**  
Most Common Unit, Estimated Net Weight, Number of Units per Hundredweight,  
Principal Vegetable Commodities, Florida, 1970-71 Crop Season

Commodity	Unit	Est. Net Weight	No. of Units per Cwt.	Commodity	Unit	Est. Net Weight	No. of Units per Cwt.
<u>Pounds</u>							
Snap Beans	Bushel	30	3.333	Lettuce	Cwt.	100	--
Cabbage	Crate	50	2,000	Green Pepper	Bushel	28	3.571
Celery	Crate	60	1.667	Potatoes	Sack	100	--
Sweet Corn	Crate	42	2.381	Squash	Bushel	42	2.381
Cucumbers	Bushel	52	1.923	Strawberries	Flat	10.25	--
Eggplant	Bushel	33	3.030	Tomatoes	Crate	40	2.500
Escarole	Crate	25	4.000	Watermelons	Cwt.	100	--

## SUMMARY OF THE 1970-71 VEGETABLE SEASON

Florida grown vegetables, melons, potatoes, and strawberries were valued at 280.9 million dollars for the 1970-71 crop year, up 9 percent from the previous season. This increase moved value of production up to approximately the level of the 1968-69 crop year. Major factors contributing to the higher value were increases in yield and price per unit for most crops. Planted acreage for the 1970-71 crop year was slightly below that of the previous season; however, harvested acreage remained about the same level due to a lower loss rate for many crops.

The value of tomatoes produced in Florida increased 21.4 million dollars over the previous year. This was the largest increase in value of production of any crop and came about in spite of a 16 percent decrease in harvested acreage. The average yield rose 44 percent and price per unit increased 9 percent over the preceding crop year. Tomatoes continue to lead all other crops in value of production. Other crops showing increases in total value were snapbeans, sweet corn, cucumbers, escarole-endive, lettuce, squash, cantaloups, watermelons, and strawberries. On the other hand, celery, cabbage, eggplant, green peppers, and potatoes decreased in value of production. Celery exhibited the largest drop, down 5.2 million dollars (21 percent) from the 1969-70 crop year.

Tomatoes, eggplant, green peppers, snap beans, cabbage, and celery showed major increases in yields. Potatoes, spinach, cantaloups, and lettuce were the only crops with yields below those of the previous season. The 17 percent reduction in yield on potatoes was the largest decrease.

Crops with increases in price were: watermelons, 35 percent; escarole, 29 percent; strawberries, 19 percent; cantaloups, 11 percent; tomatoes, 9 percent; cucumbers, 7 percent; lettuce, 4 percent; potatoes, 3 percent. Lower average prices were registered for: celery, down 32 percent; green peppers, 30 percent; cabbage, 29 percent; eggplant, 22 percent; snap beans, 14 percent; sweet corn, 8 percent; squash, 6 percent; and spinach, down 4 percent.

During August and September weather conditions were conducive to planting and early crop development. Temperatures were close to normal and rainfall was moderate to heavy over most of the State.

Conditions were relatively normal in early October. During the weekend of the 17th and 18th a cool front passed through Florida bringing showers and strong gusty winds. Temperatures averaged several degrees below normal with minimums in the low 50's in northern sections. Strong winds prevailed most of the following week.

Temperatures averaged 4 to 7 degrees below normal the first week of November as cold weather moved into Florida. The first frost was recorded in the northern part of the State and record low temperatures for November 5 were set at West Palm Beach and equaled at Miami. Cold continued in November as a new front moved through the State on the 14th and 15th. A frost on the 17th of November severely damaged the remaining tender vegetables in North and West Florida. Southern sections sustained

some wind burn to foliage and minor fruit scarring. Still another cold snap brought freezing temperatures to North and Central Florida on the 24th with record lows for November set at many stations. Little or no precipitation fell.

Temperatures were normal to above normal during December until the 26th and 27th when temperatures fell to near or below freezing with scattered frost throughout Florida. Another cold front on the 30th and 31st, accompanied by a squall line, brought over 1 inch of rain to Northern Florida, 1/2 inch to Central Florida and light rain to Southern Florida. Otherwise, rainfall was generally light throughout the State during December.

Above normal temperatures persisted during the first two weeks of January. Moderate accumulations of rain fell in North and Northcentral sections. In the third week of January, Florida experienced the worst freeze since December 1962. Record low temperatures were recorded throughout the State on the 20th and 21st. A second cold wave for the month occurred on the 27th and 28th with temperatures in the 20's in North and Central sections while southern sections recorded readings in the 30's. Duration of freezing temperatures was short.

Severe weather moved through Florida on the 6th and 7th of February, a squall line preceding a cold front brought thunderstorms, winds gusting to 90 m. p. h., isolated hail, and tornadoes. North and Central Florida received 3 to 5 inches of rain, while only 1/2 inch fell over southern sections. Another cold front on the 13th and 14th brought upper and mid 20 degree readings to North and Central Florida.

Cold weather persisted throughout much of March as fronts passed through the State almost weekly. Widely scattered showers fell during the month, but drought conditions continued in Central and South Florida.

During the first half of April, temperatures averaged below normal. The opposite was true the second half with temperatures ranging above normal. Little or no rainfall during the month.

On the 1st and 2nd of May, 1 to 2 inches of rain was received in areas south of Lake Okeechobee and in Dade County. Much needed rainfall was received State-wide during the 8th to the 14th of May with accumulations averaging 2 inches. Some stations reported 3 to 4 inches, with unofficial accounts of 6 inches in Central Florida. Southern and Central sections received 1.5 to 2.0 inches during the 15th to 21st of May. The beneficial rains received during the month could not entirely offset the effects of the prolonged drought.

Scattered thundershowers prevailed during much of June with moderate to heavy accumulation of rainfall over most of the State. Some heavy thunderstorms with hail and damaging winds occurred during the last half of the month. During the period June 19 to 25, Palm Beach reported over 5 inches of rainfall.

Data on temperatures and rainfall were supplied by ESSA and the Frost Warning Service.

1/ Vegetable crops include Snap Beans, Cabbage, Celery, Sweet Corn, Cucumbers, Eggplant, Escarole, Lettuce, Green Peppers, Squash, Spinach, and Tomatoes. Cauliflower is included 1953-54 through 1960-61. Spinach is included 1955-56 through 1970-71. Other vegetables are included 1960-61 through 1970-71.

**SNAP BEANS**  
1970-71

Florida's production of pole and bush beans totaled 4.1 million bushels during the 1970-71 crop year, an increase of 23 percent over the previous season. Some 35,200 acres of snap beans were harvested compared with 34,600 the previous season. Snapbeans yielded 115 bushels per acre, up 21 percent from the 1969-70 season.

The average f. o. b. price per bushel received, at \$4.38, was down from \$5.09 of the previous season but well above other recent years. In terms of total value of production, the reduction in price per bushel received was more than offset by increased yields. The value of the 1970-71 crop was 17.8 million dollars, a 6 percent increase over the previous season.

Snap beans are produced in areas ranging from Dade County to Northwest Florida; however, the major production areas lie in Southeast Florida. Pole beans are

produced primarily in Dade County, with some smaller acreages grown in other areas. The Pompano area leads the State in acres planted; followed by Dade County, North Florida, the Everglades area, the North Central area, the West Central area, and West Florida.

Commercial shipments of snap beans begin in October and continue into June. A relatively steady volume is available from November through May, with April traditionally the peak month. During 1970-71 crop year, 21 percent of snap bean shipments moved during April.

The severe freeze of January 20th and 21st adversely affected snap bean production. Damage to bush beans in the Pompano area was severe, with some acreage lost. Plant condition in Dade County was lowered and yields were reduced. Snapbean shipments dropped significantly following the freeze and did not regain the pre-freeze level until the week ending March 27.

CABBAGE  
1970-71

Florida growers produced 7.2 million bags and crates of cabbage for fresh market sales during the 1970-71 season, 23 percent more than the previous season. F.o.b. value of sales at \$13.8 million, however, was 13 percent less than the record \$15.9 million set during the 1969-70 season.

The increased volume is attributed to both an increase in acreage, and higher yields. A monthly survey provided data indicative of acreages transplanted or direct seeded. Growers in the Hastings area planted 9,300 acres, nearly 50 percent of the State's 18,700 acres. The North Central area plantings of 4,570 acres, were nearly 25 percent of the total.

Early plant supplies were inadequate to meet planting schedules. Most early plants are grown in beds in

Georgia and the Carolinas where adverse weather reduced production. About 90 percent of the acreage is transplanted.

Weather conditions were generally favorable for cabbage production, with the exception of a few cold periods. Record low temperatures in late November slowed growth, with some damage to young plantings. The severe freeze in late January, followed by recurring rain, frosts and cold temperatures in February reduced size and quality. Selective cutting became necessary, especially in the Hastings area. This area, with 50 percent of the acreage, marketed only 44 percent of the State's volume. Yields in the Central and Southern areas were generally better than the Hastings area.

Heaviest volume moved to market January through April with peak movement in April. F.o.b. prices in May and June were quite favorable.

## CANTALOUPS

1970-71

A total of 1,400 acres of cantaloups were planted in 1971, compared with 1,500 acres for the previous season. Even though planted acreage was down, harvested acreage increased over the 1970 crop. An estimated 1,300 acres were harvested, which was up 100 acres from the previous year.

Cantaloup yields at 65 hundredweight per acre, were down 7 percent from the 1970 season. The increase in harvested acreage, however, offset lower yields, and production increased about 1 percent.

The average price for cantaloups during 1971, at \$7.55 per hundredweight, was up 11 percent from the previous season. Total value, of \$642,000, was up 12 percent.

North Florida is the principal area of cantaloup production followed by the Southwest area, the West Central area, West Florida, and the North Central area respectively. Commercial production of cantaloup is heaviest in June. A large portion of the crop is consumed within the State.

**CELERY**  
1970-71

The 1970-71 celery season in Florida proved to be the best in several years in terms of production. Growing conditions were close to ideal as the crop yielded 671 crates per acre from a "normal" 11,600 acres. This yield was the highest since the 1966-67 season. The heavy production of 7.8 million 60-pound crates, the second largest in the past 10 years, shipped at an average f. o. b. price of \$2.54 per crate, well below other most recent years. The resulting total value of the crop, at \$19.8 million was down 21 percent from the previous year and the lowest since the 1966-67 season.

The Everglades, with about 83 percent of the harvested acreage, is the principal area of production. The North Central area (including Island Grove) with about 15 percent of the acreage also furnishes supplies throughout the season. Sarasota provides the balance of the production, cutting usually from January into May.

Preparation and seeding of plant beds began in May, with first transplants set to fields around August 1. All of the crop is transplanted. Planting was completed in the Everglades during the week ending April 5. The North

Central area finished setting plants for the season about 3 weeks later.

First cuttings were made during the last week of October and supplies had reached good volume by early December, as yields improved to 700 or more crates per acre. Cold weather in January slowed maturity in all areas and caused some young plant loss, especially in the North Central area. Some skips in April harvesting schedules resulted, as did some late-season bolting. More cold weather occurred in March, along with some minor wind burn. About 9 percent of the planted acreage was not harvested.

Statewide, harvesting schedules were generally steady during the season. From mid-December until late-May, the number of crates harvested from week to week, varied more than 10 percent in only 7 weeks.

Celery is subject to a Federal Marketing Order administered by the Florida Celery Committee. Their field supervisors provide acreage and production data. In cooperation, these data are assembled into weekly and monthly reports to the participating industry.

SWEET CORN  
1970-71

Florida, the largest sweet corn producing State, marketed 10.5 million crates during the 1970-71 season. This production was up 12 percent from the previous year and the second largest in a decade. The increased production resulted from heavier plantings which at 71,600 acres, were up 10 percent from the year previous, and a third larger than the level of 10 years ago.

The average f. o. b. return, at \$2.63 per crate was down from the \$2.86 of the previous season, but compares favorably with other recent years. With a total value of sales at \$27.7 million, sweet corn is second only to tomatoes and contributes nearly 10 percent of the total return for all vegetables, potatoes and melons.

The fall crop is produced in the Everglades, while winter supplies are grown primarily in the Pompano and Dade County areas. Harvest in the East Coast areas begins tapering in late April as the Everglades begins moving good spring volume. The North Central area (Zellwood)

furnishes the bulk of the June volume and starts pulling in late May as the Everglades passes their peak.

First plantings in late July were harvesting by late September. Supplies increased to good fall volume by mid-October. Excellent quality and yields made supplies excessive, and abandonment of mature acreage continued through November. Late January cold temperatures heavily damaged both the mature crop and young acreages in the Pompano-Dade area and reduced plantings in the Everglades. Interstate movement dropped to below 100 carlots weekly through February and most of March. Cold temperatures March 5, 8 and 21 inflicted additional damage to growing crops in the Everglades and early plantings at Zellwood, generally too late to replant in the Everglades.

The spring harvest reached a peak level in the Everglades during the week ending May 17 and continued at a high level into June. Zellwood production started in late May and rapidly increased to full volume by June 10, more than offsetting the decline in the Everglades. Full volume continued throughout June.

CUCUMBERS  
1970-71

There were 16,800 acres of cucumbers planted during the 1970-71 crop year, although adverse weather limited harvesting to 14,100 acres. This represents a 6 percent reduction in harvested acreage from the previous season. Conversely, the average yield per acre increased from 174 bushels during 1969-70 to 188 bushels during 1970-71. Total production at 2.7 million bushels, was up slightly from the previous year.

The average price per bushel received for cucumbers rose 7 percent, increasing from \$3.93 for 1969-70 to \$4.20 for 1970-71. Florida's cucumber production for the 1970-71 season was valued at 11.1 million dollars, a 9 percent increase over the previous season.

The Ft. Myers-Immokalee area is by far the leading area in the State, with more than twice the acreage of any other area. The West Central section ranks second in planted acreage, followed by the Ft. Pierce-Pompano area, the North Central area, North Florida, and Dade County. A small acreage is also grown in West Florida.

Harvest of cucumbers begins in September and continues through July. Historically, shipments are heaviest in November, April and May, with May being the peak month. Interstate shipments during the winter months are primarily imports. During the 1970-71 season the months of November and May accounted for over half of Florida's shipments.

Cold weather did considerable damage to cucumbers on several occasions during the 1970-71 season. Replanting was necessary in many areas of the State. A frost on the 17th of November and a freeze the following week killed or severely damaged plants, terminating harvest in some fields and reducing fall and early winter production potential. The severe freeze on the 20th and 21st of January killed all fields which were up and growing in the Immokalee area, necessitating replanting. Some early fields in the Wauchula area were also killed. Additional freezes in mid-February extensively damaged plantings in the Pompano, Immokalee, and West Central area, prompting further replantings. Frost and high winds in March killed or damaged plantings in the West Central and North Central areas. Replanting was again required.

EGGPLANT  
1970-71

Total acreage of eggplant in Florida continues to show a slight downward trend, with both planted and harvested acreage for the 1970-71 season lower than the four preceding crop years. A total of 1,950 acres were planted during the 1970-71 season, of which 1,870 acres were harvested. This was a 6 percent reduction in harvested acreage from the preceding season.

Although harvested acreage showed a decrease, a substantial increase in yield caused total production to increase by 27 percent, rising from 752 thousand bushels in 1969-70 to 955 thousand bushels in 1970-71. Average yield per acre was 511 bushels, 36 percent above the 376 bushels per acre obtained during the 1969-70 crop year.

The average price per bushel for eggplant took a sharp decline, falling 22 percent below the 1969-70 season. The 1970-71 season average price per bushel of \$2.81 compared to \$3.62 for the 1969-70 season. The offsetting effects of the increased production and reduced price per

bushel held value of production at about the same level. The 1970-71 crop was valued at 2.68 million dollars, 1 percent below the 1969-70 crop valued at 2.72 million dollars.

The Pompano area leads the State in production of eggplant. During the 1970-71 season, this area had nearly three times the planted acreage of any other area. In terms of planted acreage, the West Central is ranked second followed by North Florida, the North Central area, and the Ft. Myers-Immokalee area.

Shipments of eggplant occur throughout the year, but are very light from July through October. Florida furnishes practically all of the domestic production during the winter. During the 1970-71 crop year, shipments were heaviest during the months of November, December, and June. Late winter and early spring shipments were reduced by the severe freeze which occurred on January 20th and 21st. Damage was severe in the Pompano area, causing heavy replanting.

ESCAROLE - ENDIVE  
1970-71

Escarole and endive (chicory) growers combined high yields and favorable prices into a highly successful season. A 3 percent increase from the previous year in acres harvested, and a 4 percent larger yield resulted in a production of 3.4 million crates, the heaviest in this decade. The average f. o. b. price at \$2.22 per crate was 29 percent more than the \$1.72 of the year previous. The total value of the crop, at \$7.6 million, was up 39 percent from the 1969-70 season and also the largest total value received in this decade.

The Everglades is the principal producing area with 72 percent of the planted acreage. Harvest begins in late October and supplies are continuous through May. The Zellwood area, with 24 percent of the planted acreage, harvests

early and late in the season with very limited supplies during the January-March period. Smaller acreages are grown on the Lake Placid and Sarasota mucklands. Seeding was underway in August in the Everglades and Zellwood areas. Harvest for local markets began at Zellwood around mid-October, and in the Everglades in early November.

January volume was heavier than usual, with about 20 percent of the crop moving as compared with about 15 percent normally. Weather setbacks which can occur during the winter months, were not too severe, although some reduction in February volume resulted from the January cold spells. Good volume continued through May with the Everglades declining during the month and Zellwood cutting essentially completed by June 1.

LETTUCE  
1970-71

Florida's lettuce growers produced 451,000 hundredweight of lettuce during the 1970-71 season, up 15 percent from the previous year and largest since the mid-fifties. The large crop resulted from increased acreage as the average yield of 85 cwt. was the lowest since the 1964-65 season. The average f. o. b. price at \$7.97 was "about normal" and resulted in total value of \$3.6 million for the crop. This season is difficult to compare with the previous year when record plantings of 7,400 acres were matched with a huge loss of 3,000 acres.

Acreage, production and value statistics for lettuce in this bulletin combine the various types into a single estimate. These types include the predominant Iceberg and Romaine, as well as Boston, Bibb and leaf lettuce.

The Everglades dominates production, with 68 percent of the planted acreage. The North Central area, with 21 percent of the acreage is the other major producing area.

The Sarasota and Lake Placid mucklands also contribute supplies most of the season.

Direct seeding to fields was underway in September along with planting of Iceberg seedbeds for later transplanting in the North Central area. Scheduled plantings continued through March. The Everglades, Sarasota and Lake Placid mucks are planted for continuous supplies from November through May. The North Central mucks normally drop out of production from mid-December until mid-April, with limited mid-season supplies grown on the warmer sandlands.

Light harvest started at Zellwood in late October with the Everglades making first cuttings in early November. Sarasota and Lake Placid followed shortly. Heaviest movement came in December and January as cold weather in January and March caused reduced volume in the late winter months especially in the Everglades. Harvest was essentially completed by late May.

**GREEN PEPPERS**  
1970-71

Production of green peppers took an upward turn during the 1969-70 season, increasing 31 percent above the 1969-70 season. The 1970-71 production was estimated at 4.0 million bushels, compared with 3.1 million for the preceding season. This output still remains below the 6.6 million bushel production obtained during the 1967-68 crop year. The 1970-71 crop was harvested from 13,600 acres out of 15,400 total acres planted.

Yield per acre was 294 bushels, 23 percent above the 239 bushels for the 1969-70 season. The 294 bushels per acre still falls far below the 406 bushels per acre harvested from the 1967-68 crop.

Although total production of green peppers rose significantly, a 30 percent decrease in average price per bushel caused the 1970-71 crop value to drop 9 percent below the 1969-70 crop. Average price per bushel at \$4.35

was \$1.90 per bushel lower than the average price for the 1969-70 crop. The 1970-71 crop was valued at 17.4 million dollars compared with the 19.2 million dollar value for the 1969-70 crop.

Commercial shipments of green peppers normally begin in October and continue into July. Generally there is a relatively steady flow of shipments from December through June. This season, shipments were very light in February and March as a result of severe mosaic in the Pompano area and the severe freeze which occurred on January 20th and 21st.

The majority of pepper acreage for the 1970-71 season was concentrated in the Ft. Myers-Immokalee and Pompano areas. The North Central area ranked third in planted acreage followed by the West Central and North Florida areas respectively.

POTATOES  
1970-71

Production of Irish potatoes in Florida during the 1971 winter-spring season at 4.9 million hundredweight was down 18 percent from the 1970 production and 33 percent less than the bumper crop harvested in 1969. Red-skinned varieties moved primarily into fresh channels while whites were grown partly under contract by chipping firms, and partly for open market sales to the chip stock trade. Only a moderate amount of whites were sold as table stock.

South Florida plantings are classified "winter" but harvest continued into early May. Nearly 75 percent of the winter's 10,900 acres was planted to reds, heaviest in south Dade County. Late January low temperatures, dry weather and wind lowered prospects. Yields of whites at Ft. Myers - Immokalee were especially disappointing. Quality of Dade County reds was excellent; size was below normal for optimum yields, but desirable from the consumer's stand point. The winter yield was much below normal.

POTATOES (continued)  
1970-71

Hastings early spring plantings, at 23,100 acres, were about 6 percent less than the previous year's acreage. Recurring frost and prolonged cold January 20 through March, plus heavy rains February 7-8 and again in early April lowered prospects such that the average yield, at 132 cwt., was the lowest since the disastrous crop of 1967. The resulting production of 3.0 million cwt. was 25 percent less than in 1970 and nearly 38 percent less than in 1969. Total value of production at \$11.2 million was only about 18 percent less than each of those higher producing seasons.

"Other Spring" plantings were widely scattered and often grown by just one commercial grower in a county. Yields were light. The largest concentration of acreage was grown in south Hillsborough, north Manatee area.

Prices during the winter season averaged slightly lower than during the previous winter. The 1965 winter f. o. b. average at \$5.50 per cwt. apparently set a record. Hastings tubers averaged 30 cents per cwt. over the previous early spring price.

## SPINACH FOR PROCESSING

1971

In 1971, 1,700 acres of spinach were harvested, 200 acres higher than the corresponding figure for 1970. Average yield fell from 76 hundredweight per acre in 1970 to 70 hundredweight per acre in 1971. Production rose from 5,700 tons in 1970 to 5,950 tons in 1971; however, the average price for spinach fell causing value of production to remain unchanged at \$259,000.

Spinach for processing is grown on the mucklands of Orange and Lake Counties. Utilization is mainly by processing plants located in the southeastern States. The value per unit is for usable spinach on a delivered to plant basis.

The severe freeze in late January reduced spinach yields and resulted in some acreage loss.

SQUASH  
1970-71

Squash acreage planted in Florida increased for the third consecutive season, totaling 9,800 acres. Of the total, 8,700 acres were harvested, a 4 percent increase over the previous season. The combination of increased acreage harvested and higher yields resulted in a 14 percent rise in total production. Production for 1970-71 was 1.3 million bushels compared with 1.1 million bushels for the 1969-70 season. Average yield increased from 131 bushels per acre to 145 bushels per acre.

The season average price per bushel at \$4.78 compares with \$5.08 for the preceding year. In spite of the lower average price, total value of the squash crop increased 7 percent over the previous season. Value of the 1970-71 squash crop was 6.0 million dollars.

Shipments of squash were recorded in each month throughout the year; however, heaviest movement occurs from November through May. During the 1970-71 season, shipments were highest in May, when 18.6 percent of the crop was shipped.

The southeastern area of the State is the dominant area in squash production, with Dade County having the highest concentration of squash acreage in the State. The Southwest area is second in plantings, closely followed by the West Central area. Squash is also available in the spring, from the Central areas north into West Florida.

Florida produces acorn, butternut, yellow crook-neck, yellow straightneck, white, and zucchini squash.

**STRAWBERRIES**  
1970-71

Florida strawberry growers planted and harvested 1,600 acres, some 200 acres less than the preceding season. Average yield increased from 781 to 927 flats per acre, resulting in a larger total production from the smaller harvested acreage. Total production for the 1970-71 season was 1,483,000 flats, 6 percent higher than the 1,405,000 flats produced during the 1969-70 crop year.

The season average price for strawberries was \$3.57 per flat, higher than any of the four preceding seasons.

This season's crop is valued at 5.3 million dollars, 25 percent higher than the 4.2 million dollar crop produced during the 1969-70 season.

Over one-half of the strawberry acreage is in the West Central section. Dade County has the second largest acreage, followed by the North Florida area. Small acreages are also grown in other areas. The West Central section received extensive damage to fruit and bloom from the severe freeze in late January, reducing production during the following two months.

Shipments of strawberries were recorded from December into June, however, nearly all volume moved during the January through April period. March is normally the peak month for shipments. Over 44 percent of all strawberry shipments for the 1970-71 season moved during this month. About two-thirds of the total production is marketed within the State.

TOMATOES  
1970-71

Tomatoes continue to lead all other vegetables in total value of production. The 1970-71 crop value was 79.2 million dollars, 37 percent higher than the preceding season and well over twice the value of any other individual vegetable crop. Total production was 16.3 million equivalent 40 pound crates, 24 percent higher than the 1969-70 season. Of this total 14.6 million crates were utilized in the fresh market while 1.8 million crates went into processing.

Plantings for the 1970-71 season were down 19 percent with only 43,000 acres planted compared with 52,800 acres for the previous season. Of the total acreage planted, 40,700 acres were harvested. The higher production was a result of increased yields, since harvested acreage dropped 6,700 acres from the 1969-70 season. Average yield per acre was 402 crates, up 44 percent from the 279 crates recorded for the 1969-70 season.

The average price per crate for both fresh market and processing uses increased over the 1969-70 season. Tomatoes for fresh market brought an f.o.b. average of \$5.35 per crate for the previous season. This price was higher than any of the twelve previous seasons. Average price per crate for processing increased from \$0.65 in

1969-70 to \$0.69 for the 1970-71 season, on a delivered to plant basis.

Commercial shipments of tomatoes began in November and continued through June, with some light movement in July. Shipments reached a high point in May, when 21.6 percent of the crop moved. December was the second highest volume month, with 19.3 percent of the recorded shipments.

Dade County leads the State in tomato acreage, followed by the Ft. Pierce-Pompano area, the Ft. Myers-Immokalee area, and the West Central area. A small acreage of ground tomatoes is grown in the North Central area, and in North and West Florida.

Nearly all tomato areas experienced some adverse weather during the 1970-71 season. In September, Dade County lost and reseeded about 1,000 acres due to intense heat and lack of moisture. The severe freeze in late January caused damage to the crop in all areas, with damage ranging from foliage burn and bloom drop, to complete acreage loss. During February, further damage was caused by frosts and high winds. During the first week of March, the North Central and West Central areas experienced severe damage and plant loss as a result of high winds.

WATERMELONS  
1970-71

Florida growers produced 7,515,000 hundredweight of watermelons during the 1970-71 season, a 9 percent increase over the previous crop year. The increased production resulted from a 5 percent increase in harvested acreage and a 3 percent increase in yield. Slightly over 50,000 acres were harvested, yielding an average of 150 cwt. per acre.

The average price per cwt. was \$2.72, 35 percent higher than the \$2.02 realized a year earlier. Total value of production was 20.0 million dollars, 47 percent above the 13.9 million dollar value placed on the 1969-70 crop. Both average price per cwt. and total value of production were the highest in the past decade.

Shipments of Florida watermelons began in April and finished in July. Over 69 percent of the season's shipments occurred in June.

Watermelon production starts in the Ft. Myers-Immokalee area around April 1 and progresses through Central areas during May. North Florida furnishes heavy June marketings. West Florida's harvest begins in June and continues well into July.

Cold weather set the crop back on several occasions during the 1970-71 season. The severe freeze in late January damaged or killed plants in the Ft. Myers-Immokalee and West Central areas. Extensive replanting was necessary. Cold temperatures, frost and winds in mid and late February caused further damage to the watermelon crop. Replanting was necessitated from the Ft. Myers-Immokalee area to the North Central area. Seeding in North and West Florida was delayed by the adverse weather. The replanting and delayed planting resulting from the adverse weather during early 1971 caused initial production to be lower than normal. Volume was relatively low during April and May, however, the delay caused June's volume to be above normal.

Watermelons: Acreage, Production, and Value in Florida,  
Crop Years 1960-61 through 1970-71
